

Air formatter for R

posit-dev.github.io/air

- When you install Positron, you get Air "for free" as a bootstrapped extension.
- Air formats your R code based on some opinionated, but also widely-used and agreed-upon, conventions — details at posit-dev.github.io/air/formatter.html.

Air + Positron: practical suggestions

- Air extension ships with Positron and includes the Air binary so Air should just work in Positron.
- You can configure Air to be used at the
 - user level to say “I use Air to format the R code in all of my projects”: by adjusting your user setting (more on this in the next module) or
 - workspace level to say “We use Air to format the R code in this project”: by adjusting your workspace settings (more on this in the next module too) or with `usethis::use_air()`*
- You can also use Air “one-off” from the *Command palette*:
 - *Air: Format Workspace Folder*
 - *Air: Format Document*
 - *Air: Format Selection*
- The Git diff is a great way to see what has changed, so inspect it before committing and pushing!
- There are various ways to disable Air formatting of a specific file, line (or lines in a pipeline), etc.

* Currently requires dev version of usethis
