posit::conf(2026) is coming to Houston, TX! Join us Sept 14–16.

RSVP NOW

Learning Objective

Enable every participant to begin using Positron today for data science workflows in R.

1. **Introduction to Positron**

- RStudio transition to Positron
- Customizing Positron Settings
- R Projects and Packages
- File management
- Git Integration

2. **AI with Posit Assistant**

- Introduction to Posit Assistant
- Data exploration with Posit Assistant
- Coding with Posit Assistant
- Context management
- Commands
- Skills

3. **Clinical Data Wrangling and Analysis**

- Exploring AdaM data
- Building plots and tables with the DT package
- Publishing reports
- Introduction to Quarto

Multiple Consoles

Let you switch between different versions of R

The screenshot shows the RStudio interface with the 'CONSOLE' tab selected. The main console area displays the output of an R session, including the version number (4.4.0) and the license information. A pink arrow points from the title 'Multiple Consoles' to the right-hand sidebar, which lists three R sessions: R 4.6.0, R 4.5.2, and R 4.4.0. The R 4.4.0 session is currently selected and highlighted in blue. Below the session list, a progress bar shows 0% completion and 177MB of memory usage.

CONSOLE TERMINAL PROBLEMS OUTPUT PLOTS DEBUG CONSOLE + v | - X □ □

Packages

Moved to
left-hand sidebar

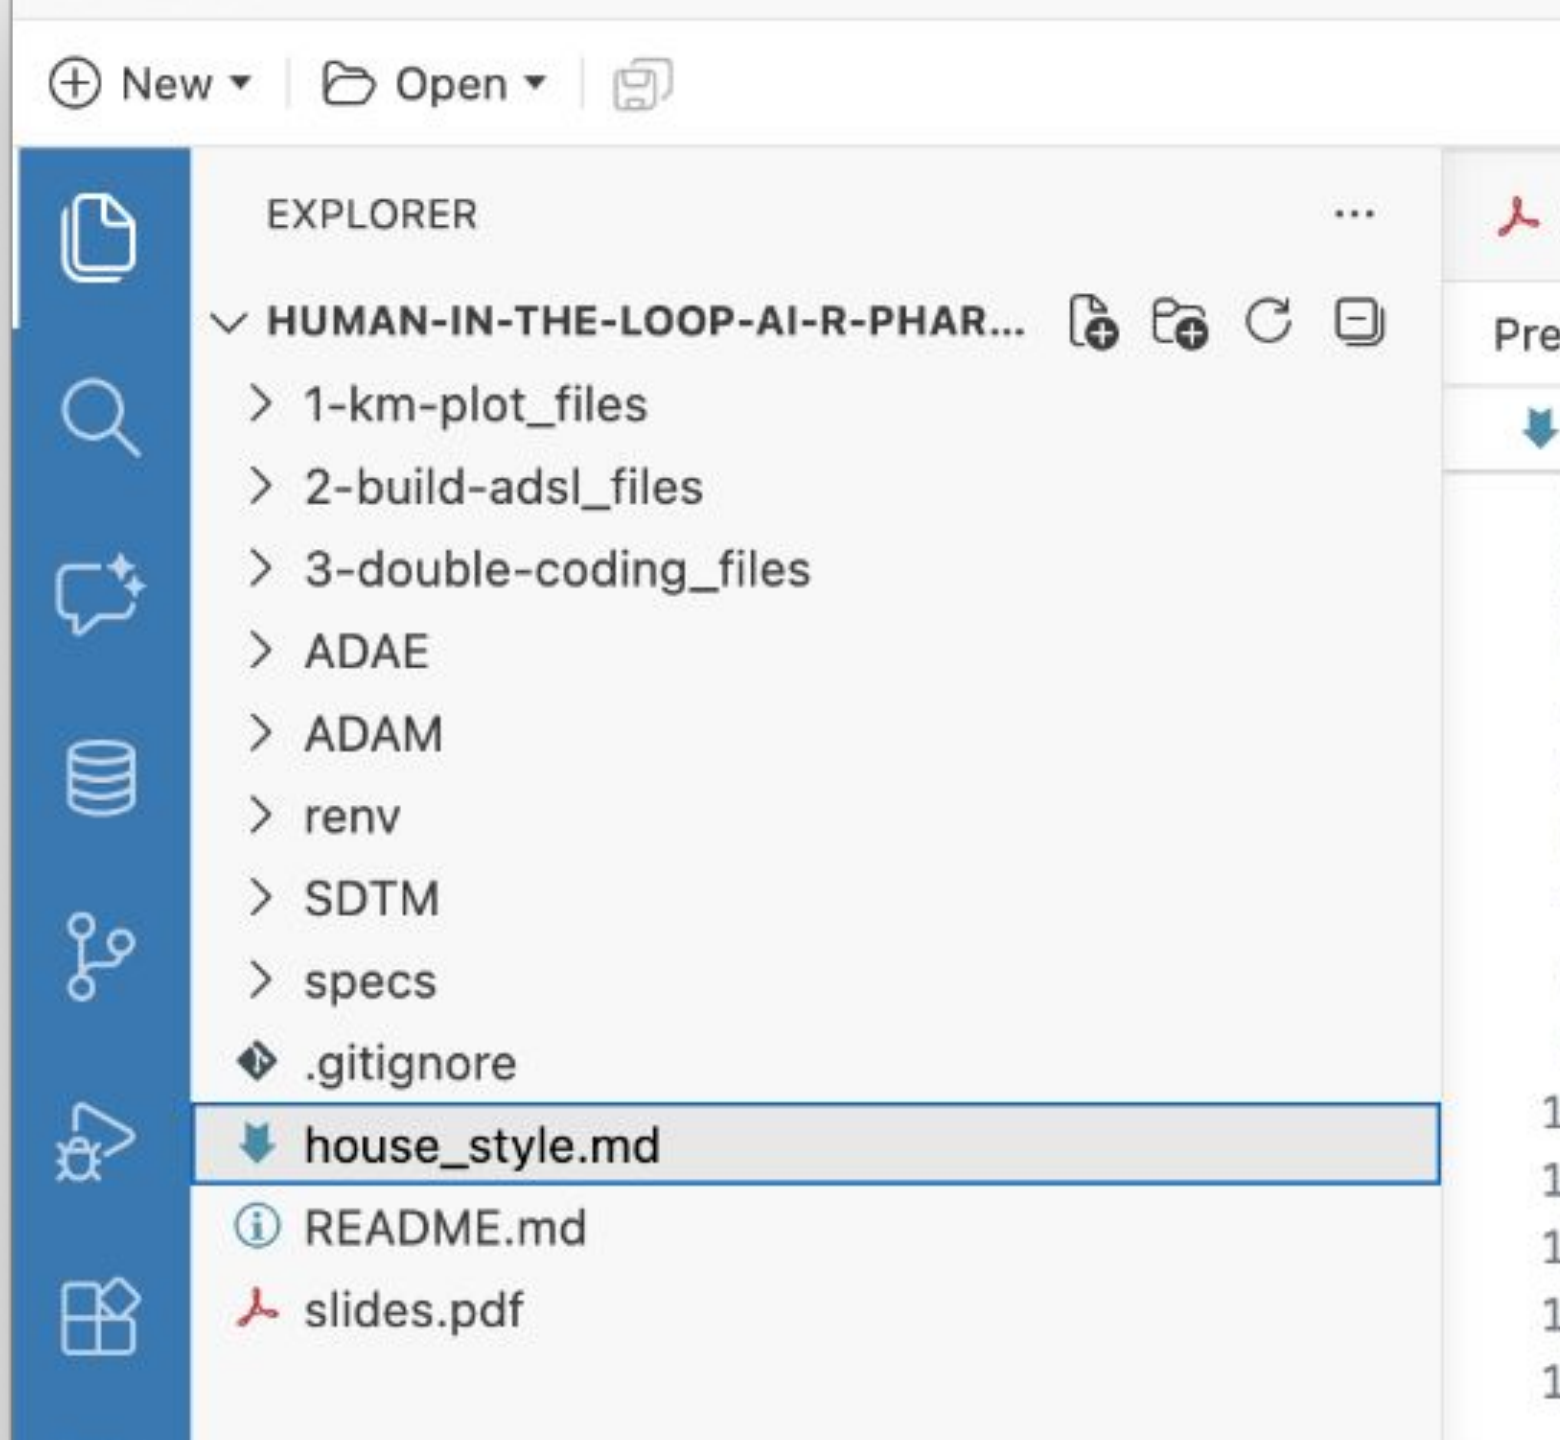

The image shows the RStudio interface. On the left is a blue sidebar with icons for various RStudio functions: a computer with a checkmark, a flask, a diamond with a plus, an upward arrow, a GitHub logo, a cube, and a three-dot menu. To the right of the sidebar is a list of installed R packages. The list includes:

- codetools** 0.2-20: Code analysis tools for R.
- compiler** 4.4.0: Byte code compiler for R.
- datasets** 4.4.0: Base R datasets.
- foreign** 0.8-86: Reading and writing data stored by some versions of 'Epi Info', 'Minita...
- graphics** 4.4.0: R functions for base graphics.

Each package entry has a status icon (a circle with a checkmark for installed, or an empty circle for not installed) and a version number. The 'Update' button is visible next to the 'foreign' package. On the far right, a partial view of the R console is visible, showing the prompt 'R 4...' and some text.

Posit Assistant

An

AI client

within Positron.

1. Adds skills
2. Shares R sessions
3. WEAR loop

Documentation at

assistant.posit.co

The screenshot displays the Posit Assistant web application in a browser window. The browser's address bar shows the URL `assistant.posit.co`. The application header includes the Posit Assistant logo, navigation links for `DOCS`, `GUIDES`, and `DOWNLOADS`, and a search bar containing the text `%K`.

The main content area features a large heading `DOCUMENTATION` followed by the title `Posit Assistant` and the tagline `The agentic harness for data science.` Below this are two prominent buttons: `GET STARTED` and `CONFIGURATION`.

The lower portion of the page is a detailed documentation for the `penguins` dataset. It includes a scatter plot of `bill length (mm)` versus `bill depth (mm)`. The text describes the dataset structure: 344 penguins, 3 species (Adelie, Chinstrap, Gentoo), across 3 islands, with 8 variables and 11 missing values. It provides species-specific notes, such as Chinstrap being found only on Dream Island and Adelie spreading across all three. A section on 'Between-species differences' lists characteristics like Gentoo being the largest birds and Chinstrap having the longest bills. A scatter plot is also shown with the caption: 'The scatter plot shows something interesting: there's an apparent negative correlation between bill length and bill depth when you look at the full dataset, but within each species the relationship is actually flat or slightly positive. This is a classic example of Simpson's paradox — species composition drives the overall pattern.'

Below the text, there are several code snippets and their outputs. One snippet shows the `glimpse(penguins)` command and its output, which lists the first few rows of the dataset. Another snippet shows the `summarise()` command used to calculate the mean bill length and depth for each species. A third snippet shows the `ggplot()` command used to create a scatter plot of bill dimensions by species, with points colored by species and labeled with species names.

On the right side of the documentation, there is a sidebar with a 'Data' section showing the `penguins` dataset with 344 observations and 17 variables. Below this is a 'Plots' section showing a preview of the scatter plot titled 'Bill dimensions by species'.

Open Posit Assistant.

Confirm that you are connected
to a model provider.

The LLM
can see
what
happens
in Positron

The screenshot displays the Positron IDE interface. On the left, the 'POSIT ASSISTANT' sidebar is visible. The main editor shows an R script titled '01-report.qmd' with sections for 'Geographic Distribution', 'Income distribution', and 'Detailed'. The 'Income distribution' section contains R code for loading data and plotting per capita spend by income group. On the right, the 'SESSION' panel shows the 'peachtree_lottery' data frame and the 'plot_per_capita_spend' function. Below this, a bar chart titled 'Income' is displayed, showing the distribution of per capita spend across income groups.

Income Distribution Data (Estimated from Chart):

Income Group	Per Capita Spend (Approx.)
Under \$15K	400
\$15K-\$30K	350
\$30K-\$50K	300
\$50K-\$75K	250
\$75K-\$100K	200
\$100K-\$150K	180
\$150K+	150

Quiz

Does this code return an error?

```
hist(cases$amount)
```

This enables
a loop:
Run code.
See results.

The screenshot displays the Posit Assistant interface, which is designed for running and visualizing R code. The interface is divided into several panels:

- Left Panel:** Contains the Posit Assistant logo and a sidebar with various tool icons.
- Center Panel:** Displays the R code being executed. The code includes comments and function calls for geographic distribution, income distribution, and detailed analysis. A large orange arrow points from the Posit Assistant logo to the code, indicating the execution process.
- Right Panel:** Shows the results of the code execution, including a bar chart titled "Income" and a table of variables. A large orange arrow points from the code to the results, indicating the output of the execution.
- Bottom Panel:** Displays the terminal output, showing the execution of the R code and the resulting data structure.

The code in the center panel includes the following sections:

- Geographic Distribution:** A comment indicating that darker colors indicate higher per-capita spending. The code defines a function `create_lottery_map` and calls it with `peachtree_lottery` and `per_capita = TRUE`.
- Income Distribution:** A comment indicating that the code shows per-capita sales by income group. The code defines a function `plot_per_capita_spend` and calls it with `peachtree_lottery` and `income`.
- Detailed Analysis:** A comment indicating that the code shows the distribution of per-capita spending by income group. The code defines a function `plot_per_capita_spend` and calls it with `peachtree_lottery` and `income`.

The results in the right panel show a bar chart titled "Income" with the following data series:

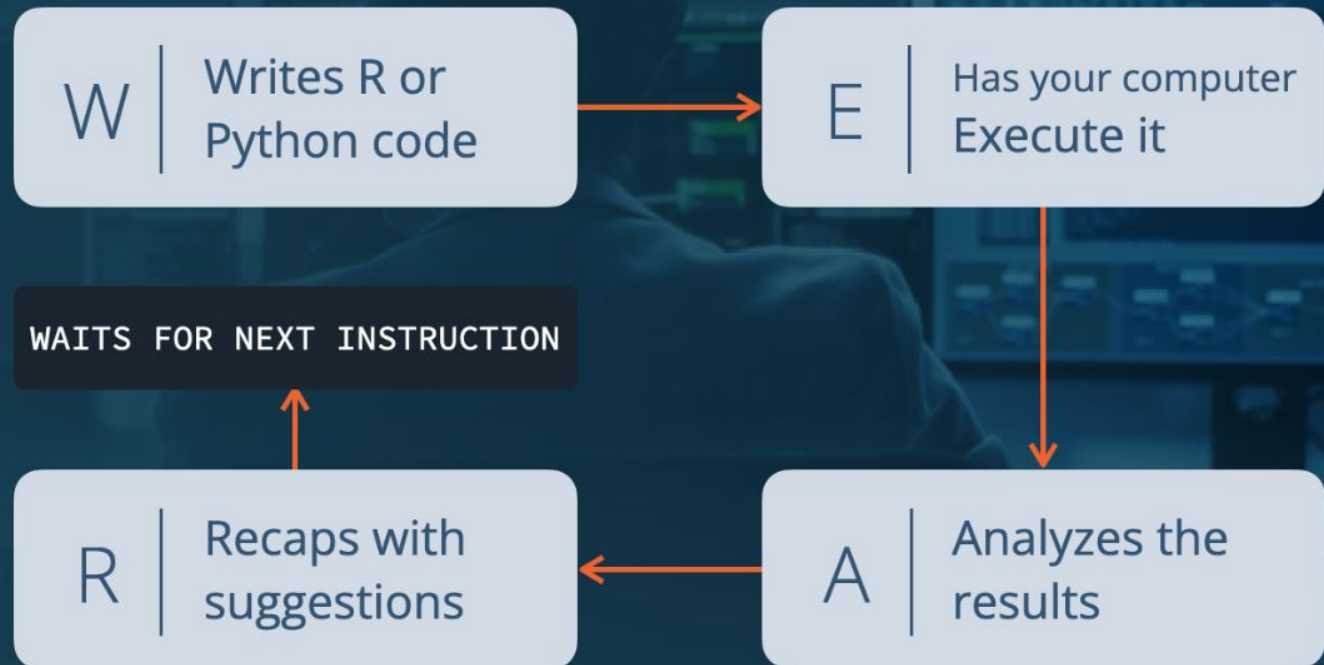

Income Group	Per-capita Sales
Under \$15K	~450
\$15K-\$30K	~400
\$30K-\$50K	~350
\$50K-\$75K	~300
\$75K-\$100K	~250
\$100K-\$150K	~200
\$150K+	~150

WEAR loop

Code is the

most auditable

way to explore
data with AI

Use Posit Assistant to explore the datasets in the ADAM folder.

 **executeCode:** load both ADAE extracts and compare structure

Can Posit Assistant use executeCode?

Posit Assistant would like to run this R code to load both ADAE extracts and compare structure.

```
library(tidyverse)

prod <- read_csv("ADAE/ADAE_prod.csv", show_col_types = FALSE)
qc <- read_csv("ADAE/ADAE_qc.csv", show_col_types = FALSE)

list(
  dim_prod = dim(prod),
  dim_qc = dim(qc)
)
```

✓ Allow

Ask Posit AI

🌐 🚫 🤖

👁️ R 🔥 30:03 ● 27K · \$0.08 ⚡ Haiku 4.5

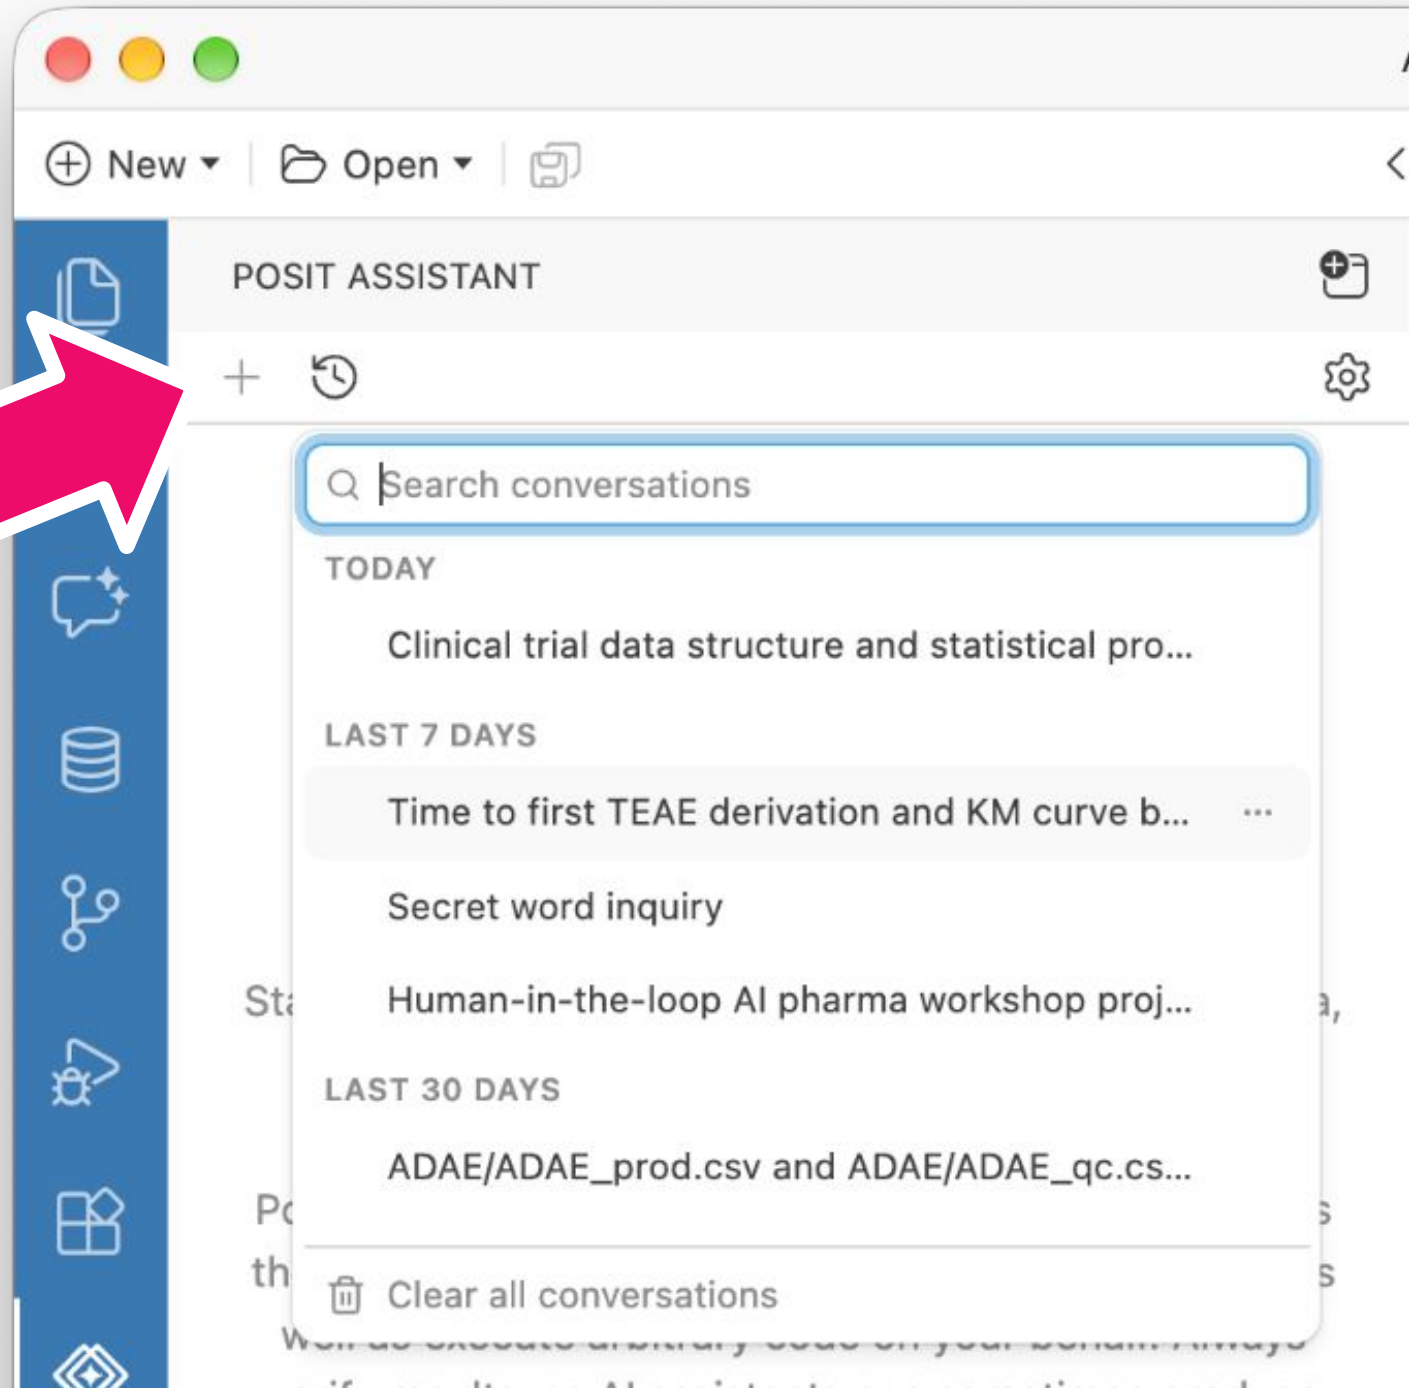

To minimize token usage

1. Select the smallest **model** for the job
2. Keep the **cache** warm if you plan to do more soon
3. Monitor **conversation length**
4. Write clear, detailed (i.e. long) **prompts**

Start a new Conversation

Or return to a previous one

Ask Posit Assistant:

Use ADAM/ADAE.csv and ADAM/ADSL.csv to derive the time to first treatment-emergent adverse event for the safety population and plot a Kaplan-Meier curve by ARM.

Teaching the AI

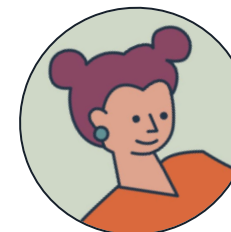

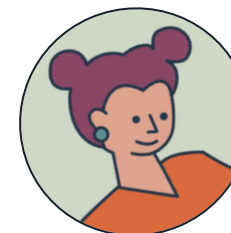

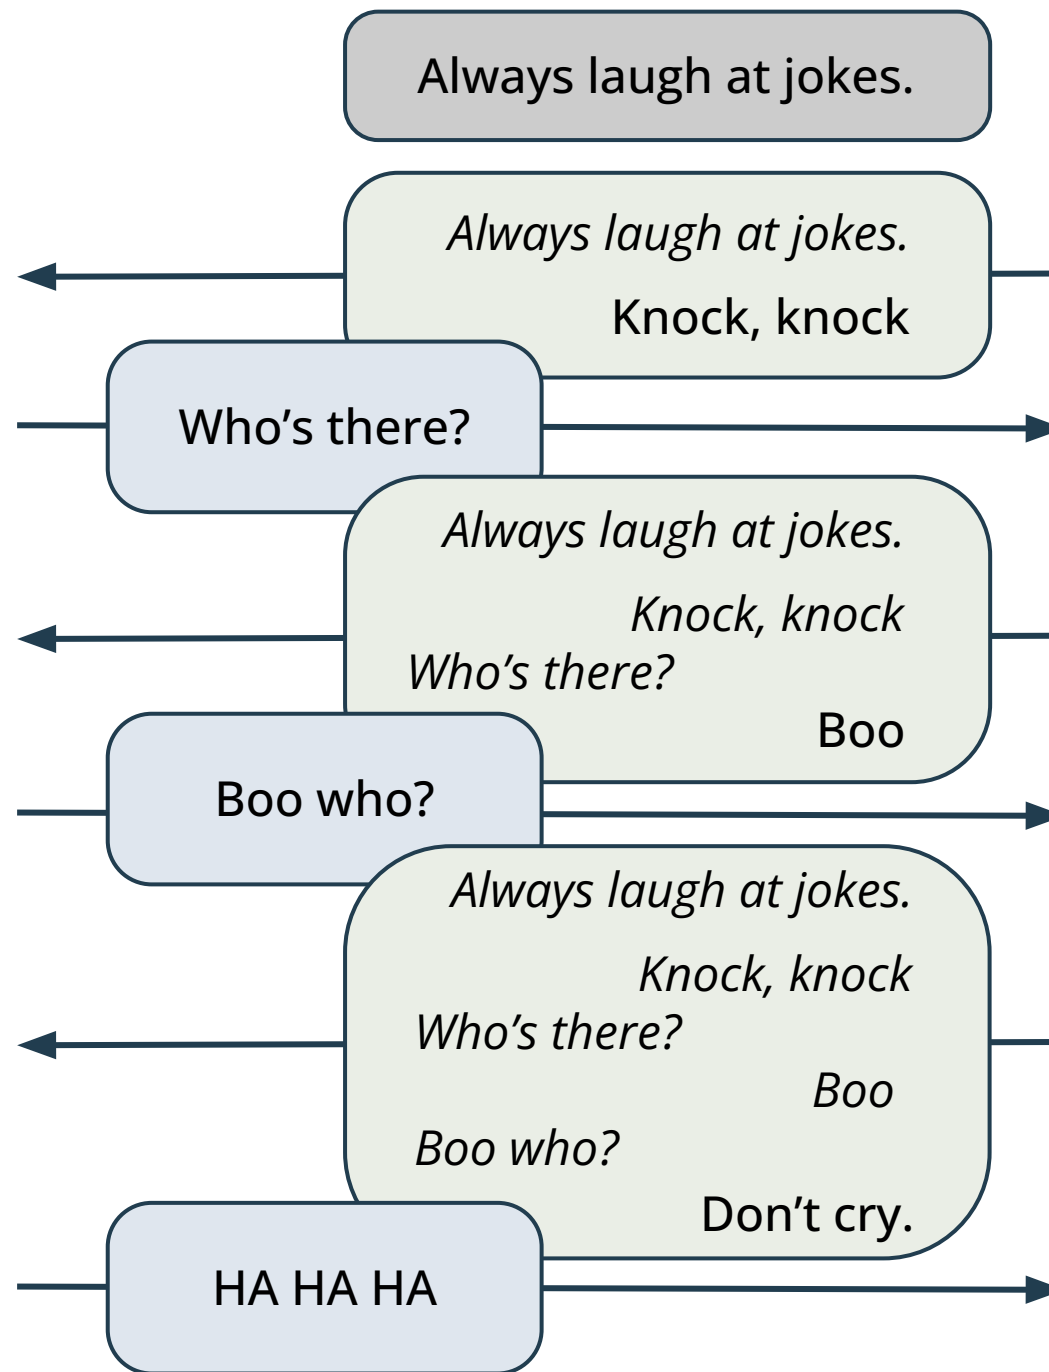

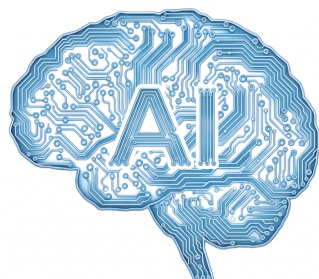

Memory (AGENTS.md)

Instructions to know for every conversation

Skills

Just-in-time instructions on specific topics

AGENTS.md

Make a file named AGENTS.md. Save this in it.

1. Kaplan-Meier figures

- **Palette** (by arm, in this fixed order): Placebo = `#BDBDBD` (grey), low dose = `#4A90D9` (blue), high dose = `#D9534F` (red). Always map arms to colors in protocol order, not alphabetical order.
- **Always include:** a number-at-risk table below the x-axis, and a 95% confidence band (shaded, 20% opacity). The risk table should be no smaller than 85% of the plot to ensure legibility.
- **Legend placement:** the legend must never overlap the plot area, since this obscures the data. Always orient the legend horizontally and place it beneath the plot.
- **Axis labels:** x-axis in days unless the audience is a general clinical one, in which case convert to months (divide by 30.4375) and say so in a footnote.
- **Title format:** `"<Endpoint> by Treatment Arm"` -- e.g. `"Progression-Free Survival by Treatment Arm"`. No dataset name, no study ID, in the title itself (those go in a caption/footnote).
- **Censoring marks:** show tick marks for censored observations; do not hide them for a "cleaner" look.
- **Y axis limits:** the y axis should always begin at 0 and end at 1.

In a new conversation, remake your plot.

Use ADAM/ADAE.csv and ADAM/ADSL.csv to derive the time to first treatment-emergent adverse event for the safety population and plot a Kaplan-Meier curve by ARM.

Hi

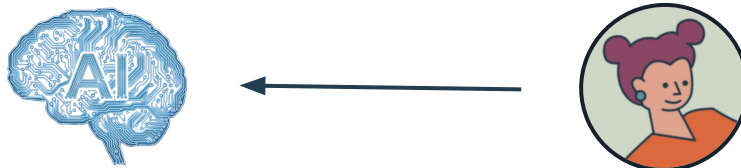

MCP

There are three tools you can use:

- **The Plot tool**
What the plot tool does. How to use the plot tool. What the plot tool returns. This takes many lines that get loaded into every conversation.
- **The Table tool**
What the tool...

Hi

Skills

These are available to read if you need them:

- How to make **plots**
- How to make **tables**

Hi

Posit makes and shares skills

A collection of skills from Posit

<https://github.com/posit-dev/skills>

In a new conversation, make a table.

Use ADAM/ADAE.csv and ADAM/ADSL.csv and the DT package to create a table of the top 10 treatment-emergent adverse events (TRTEMFL == "Y", SAFFL == "Y"). Show counts and percentages by treatment arm.

Give Posit Assistant specific instructions on how to improve the table. Consider how to format values, sort rows, label columns, etc. Make the revised table.

Create a skill with

/create-skill

Slash Commands

- `/compact` Compact conversation to reduce token usage
- `/context` Show session context and token usage
- `/clear` Start a new conversation, keeping the current context
- `/clean` Enter Cleaning mode
- `/create-skill` Create new Agent Skills following the template
- `/marketplace` Open the plugin & marketplace menu
- `/mcp` Show MCP servers and sign in to them
- `/microcompact` Micro-compact tool results in the chat

/

Claude 4 Sonnet ▾

Run

/create-skill Create a skill that makes adverse event tables like the one we just made. An LLM should be able to use the skill to provide a table in my preferred style whenever I ask for a similar table.
